

# Data Visualization with Leaflet

Data Boot Camp

Lesson 15.1

# Class Objectives

---

By the end of this lesson, you will be able to:

Discuss the benefits of visualizing data with maps.

Create maps and plot data with the Leaflet.js library.

Parse data from the GeoJSON format to create map-based data visualizations.

Describe the concepts of layers and layer controls and how they are applied to add interactivity to maps.

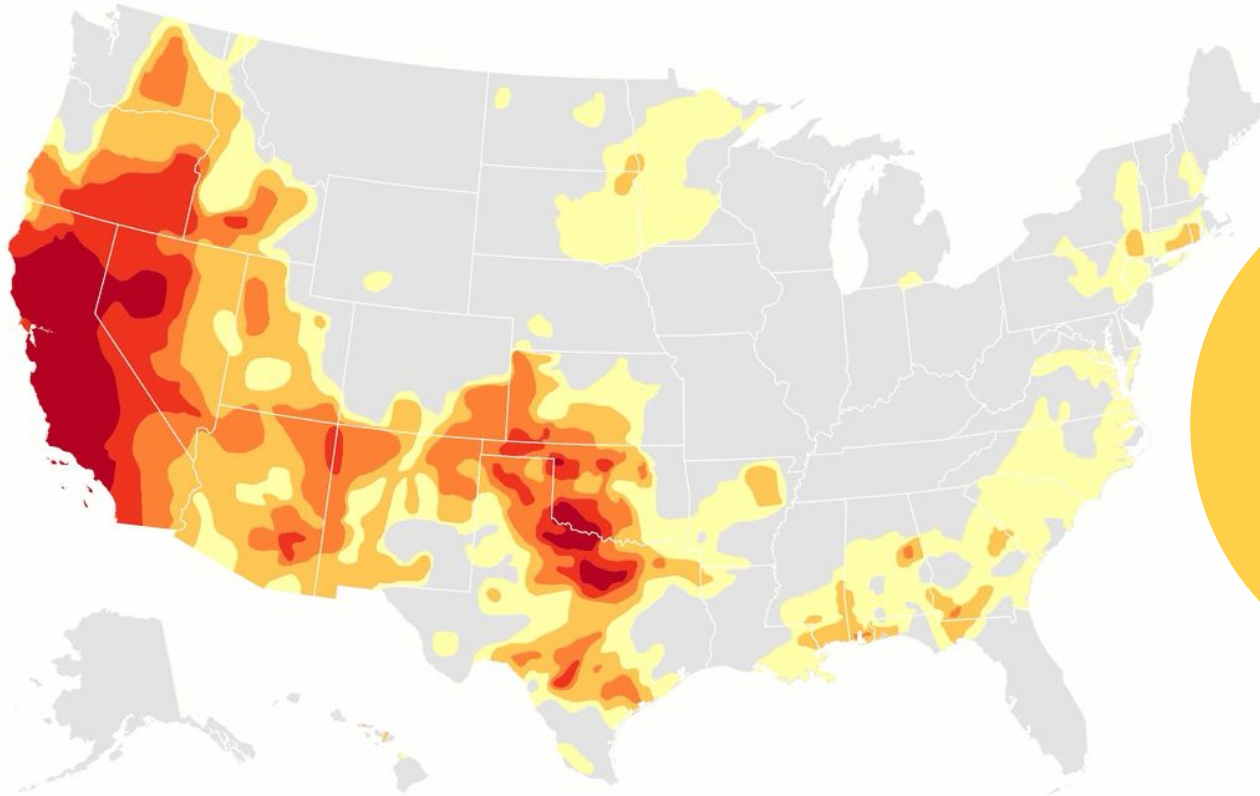

**Why is visualizing data in a geographical context beneficial?**

# Data Visualization with Leaflet

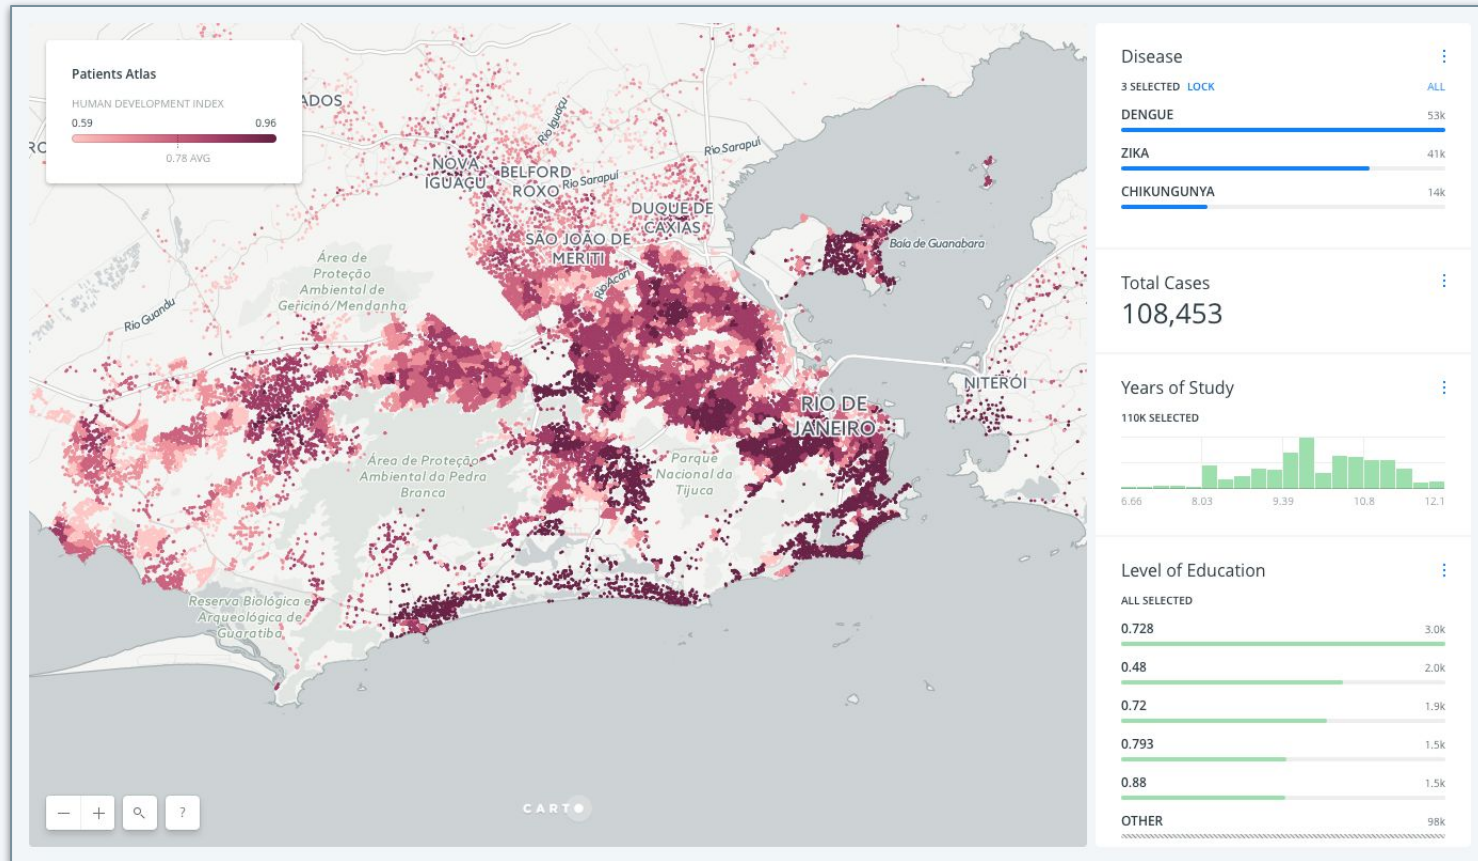

## DROUGHT SEVERITY

November-now

Geographically mapped data can help us understand the meaning of the numbers beyond what is evident in analyzing tables or lists.

# Data Visualization with Leaflet

**What other kinds of datasets  
or problems seem suitable for  
this type of data visualization?**

# Time to Code

## Create Our First Map using Leaflet

Suggested Time:

---

10 minutes

# Questions?

# Instructor Demonstration

---

## Add Markers to the Map

# Activity: City Markers

In this activity, you'll create a map and plot markers for five United States cities.

Suggested Time:

15 minutes

# Activity: City Markers

## Instructions

Use the starter files `index.html`, `logic.js`, and `style.css` provided in the [Unsolved folder](#).

Add markers to your map for the following US cities:

City	Latitude	Longitude
New York	40.7128	-74.0059
Los Angeles	34.0522	-118.2437
Houston	29.7604	-95.3698
Omaha	41.2524	-95.9980
Chicago	41.8781	-87.6298

For each city, create a marker with a popup that displays the city's name and population. You can either look up the population for each city or make one up for this exercise.

## Bonus

A popup takes a string of HTML. If you finish early, try experimenting with passing different tags or custom CSS.

## Hint

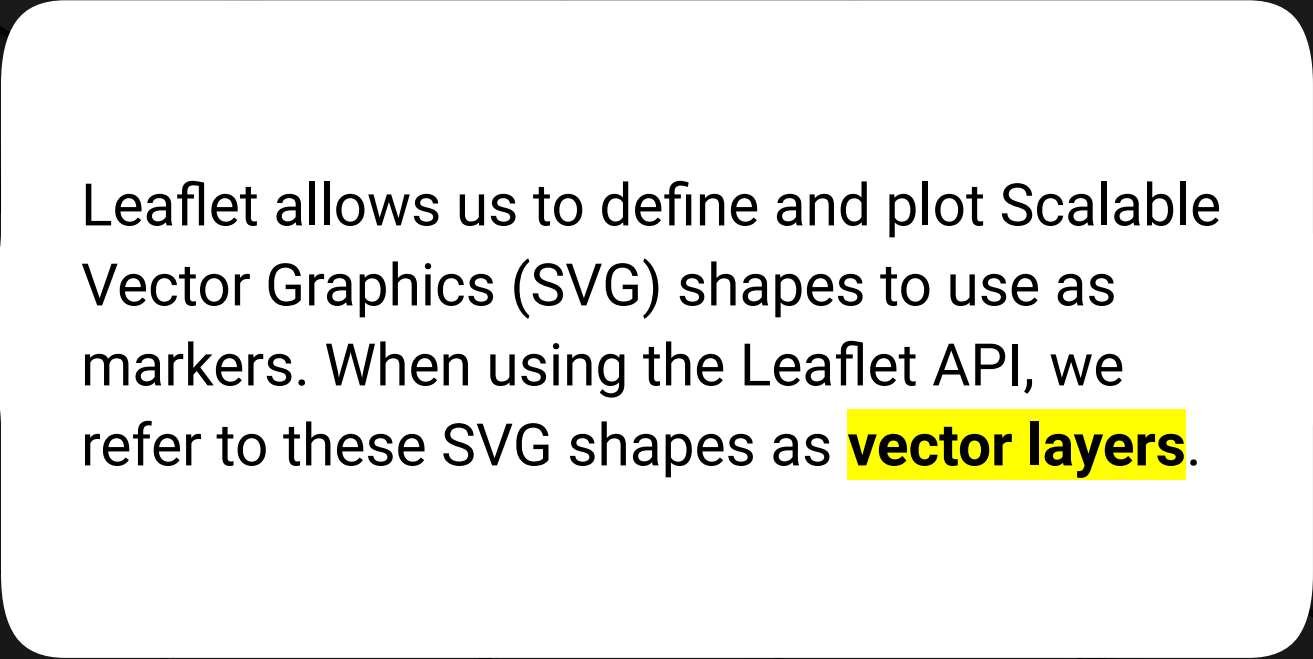

Don't forget to add the marker to your map after creating it.

Time's Up! Let's Review.

**Markers are great, but what if we want to represent an area that spans more than a single point on a map?**

Leaflet allows us to define and plot Scalable Vector Graphics (SVG) shapes to use as markers. When using the Leaflet API, we refer to these SVG shapes as **vector layers**.

## Instructor Demonstration

---

Add Other Types of Markers

# Add Markers to the Map

---

Adding a new marker by adding a new marker object:

logic.js 

```
let myMap = L.map("map", {  
  center: [45.52, -122.67],  
  zoom: 13`  
});  
  
L.tileLayer('https://{s}.tile.openstreetmap.org/{z}/{x}/{y}.png', {  
  attribution: '&copy; <a  
href="https://www.openstreetmap.org/copyright">OpenStreetMap</a> contributors'  
}).addTo(myMap);
```

# Add Markers to the Map

Method we use to  
add each map layer

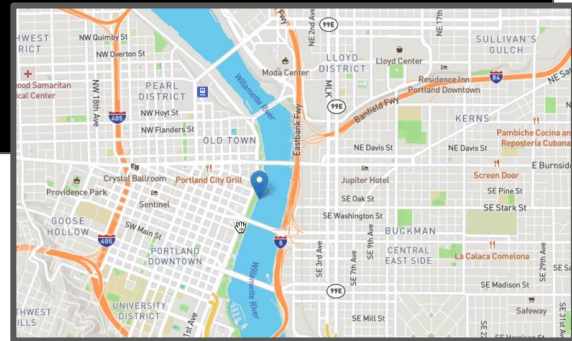

```
// Create a new marker
// Pass in some initial options, and then add
it to the map using the addTo method
let marker = L.marker([45.52, -122.67], {
  draggable: true,
  title: "My First Marker"
}).addTo(myMap);
```

Method we use  
to add text to the  
marker when clicked

```
// Binding a pop-up to our marker
marker.bindPopup("Hello There!");
```

# Activity: Other Markers

In this activity, you will work with different types of vector layers.

Suggested Time:

10 minutes

# Activity: Other Markers

## Instructions

Use the starter files `index.html`, `logic.js`, and `style.css` provided in the [Unsolved](#) folder. Create the following vector layers, and then add them to the map:

- A red circle over the city of Dallas (`[32.7767, -96.7979]`)
- A line connecting NYC (`[40.7128, -74.0060]`) to Toronto (`[43.6532, -79.3832]`)
- A polygon that covers the area inside Atlanta (`[33.7490, -84.3880]`), Savannah (`[32.0809, -81.0912]`), Jacksonville (`[30.3322, -81.6557]`), and Montgomery (`[32.3792, -86.3077]`)

## Hint

Note that the [logic.js](#) file contains some starter code.

Use the Vector Layers section of the [Leaflet documentation](#) for reference.

Time's Up! Let's Review.

**What are some of the different types  
of vector shapes that are available to us?**

# Types of Vector Shapes

---

**Polyline**

**Rectangle**

**Polygon**

**Circle**

**What arguments do our vector layers  
accept when we create them?**

# Arguments

---

They accept the following two arguments:

01

An array of coordinates that describes where our shape should appear.

02

A configuration object that describes the styles to apply to the shape.

The [Leaflet documentation](#) for Path options has a complete list of the style options that we can use for vector layers.

A close-up, high-angle shot of a computer keyboard. The central focus is a large, white, rectangular key with rounded corners. On this key, there is a dark blue icon of a coffee cup with three wavy lines above it representing steam. Below the icon, the word "Break" is printed in a dark blue, serif font. The key is set against a light-colored, textured keyboard surface. Surrounding the main key are other keys, including one with a double quote symbol to the left and one with a dash/slash symbol to the right, all of which are slightly out of focus.

# Instructor Demonstration

---

## Visualize City Populations

# Activity: Visualize World GDP Per Capita

In this activity, you will work with different types of vector layers.

Suggested Time:

15 minutes

# Activity: Visualize World GDP Per Capita

## Instructions

Use the starter files `index.html`, `logic.js`, and `style.css` provided in the [Unsolved](#) folder.

Add your code to [logic.js](#) to render the following:

- A circle for each country in the dataset.
- A radius size that you determine from the country's GDP per capita.

A color for each circle that you determine as follows:

- For countries with more than 100,000 GDP per capita, set the color of the circle to **yellow**.
- For countries with more than 75,000 GDP per capita, set the color of the circle to **blue**.
- For countries with more than 50,000 GDP per capita, set the color of the circle to **green**.
- Render the remaining country circles in **violet**.

Make sure that each vector layer has a popup containing the country's name and GDP per capita.

## Hint

Universally adjust the radius for better visuals.

Refer to the [Leaflet documentation for Path options](#) if you get stuck creating vector layers.

Time's Up! Let's Review.

# Visualize World GDP Per Capita

---

Key concepts:

We set our marker's **radius** based on the country's GDP per capita.

We use conditionals to determine color.

We use custom map styles as a way to express data.

We use a popup to display additional information.

# Questions?

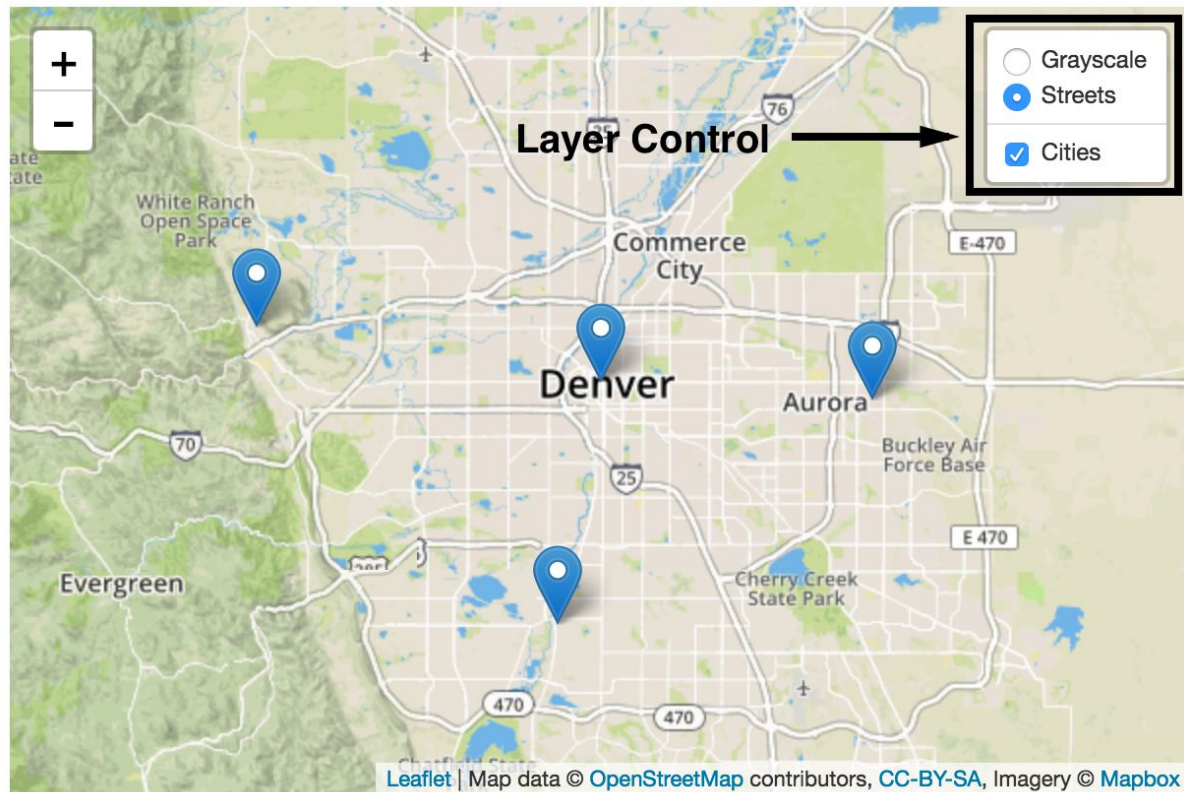

# Layer Groups and Layer Controls

# Layer Groups and Layer Controls

So far, we've used only one layer with our maps.

The OpenStreetMap API has supplied these maps to us. However, we can use multiple layers on the same map and then toggle between layers using layer controls.

# Leaflet Has Two Types of Layers

Leaflet has two types of layers.

## Base Layers

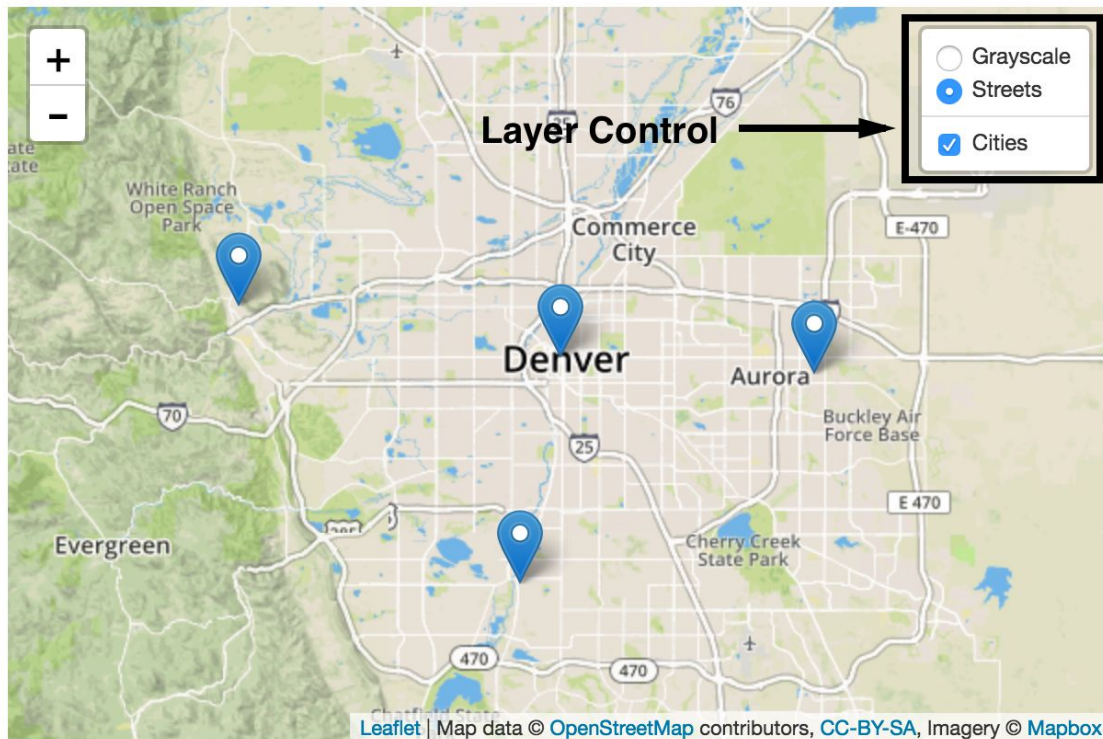

Base layers are mutually exclusive (only one can be visible at a time).

In this example, they are the Streets and Grayscale layers. We can observe only one or the other at a time, and one of these layers must always be visible.

## Overlays

We can turn them off entirely.

In this example, the overlay contains the city markers.

# Layer Groups

---

We can group our markers together to create new overlays by using layer groups. We can then toggle a set of related markers on or off as a group.

**Example:** You have a bunch of layers you want to combine into a group to handle them as one in your code:

```
var littleton = L.marker([39.61, -105.02]).bindPopup('This is Littleton, CO. '),
    denver     = L.marker([39.74, -104.99]).bindPopup('This is Denver, CO. '),
    aurora     = L.marker([39.73, -104.8]).bindPopup('This is Aurora, CO. '),
    golden     = L.marker([39.77, -105.23]).bindPopup('This is Golden, CO. ');
```

Instead of adding them directly to the map, you can do the following using the `layerGroup` class.

```
var cities = L.layerGroup([littleton, denver, aurora, golden]);
```

# Layer Groups

---

Easy enough! Now you have `cities` layer that combines your city markers into one layer you can add or remove from the map at once.

```
var littleton = L.marker([39.61, -105.02]).bindPopup('This is Littleton, CO. '),  
    denver     = L.marker([39.74, -104.99]).bindPopup('This is Denver, CO. '),  
    aurora     = L.marker([39.73, -104.8]).bindPopup('This is Aurora, CO. '),  
    golden     = L.marker([39.77, -105.23]).bindPopup('This is Golden, CO.');
```

```
var cities = L.layerGroup([littleton, denver, aurora, golden]);
```

We are creating markers in the same way as before, but instead of directly applying the markers individually to the map, we add these markers to a layer group named `cities`.

## Activity: Perform a Layer

In this activity, you'll expand on a previous activity by adding an overlay to represent state populations. This layer will appear on the map as white circle vectors.

Suggested Time:

15 minutes

# Activity: Perform a Layer

## Instructions

Use the starter files `index.html`, `logic.js`, and `style.css` provided in the [Unsolved](#) folder.

Open the [logic.js file](#) in the Unsolved folder.

Add logic to this file as follows:

- Create a layer group for city markers and a separate layer group for state markers. Note that the `cityMarkers` and `stateMarkers` arrays contain all the markers, which have been created for you. Store these layer groups in variables named `cities` and `states`.
- Create a `baseMaps` object to contain the `street` and `topo` tiles, which have already been defined.
- Create an `overlayMaps` object to contain the `State Population` and `City Population` layers.
- Add a `layers` key to the options object in the `L.map` method, and set its value to an array that contains our `street`, `states`, and `cities` layers. These will determine which layers display when the map first loads.
- Create a layer control, and pass it the `baseMaps` and `overlayMaps` objects. Add the layer control to the map.

## Hint

Refer to the [Leaflet Layer Groups](#) and Layers Control tutorial if you need help.

If everything is correct, you can toggle between the Street Map and Topographic Map base layers and turn the State Population and City Population overlays on and off.

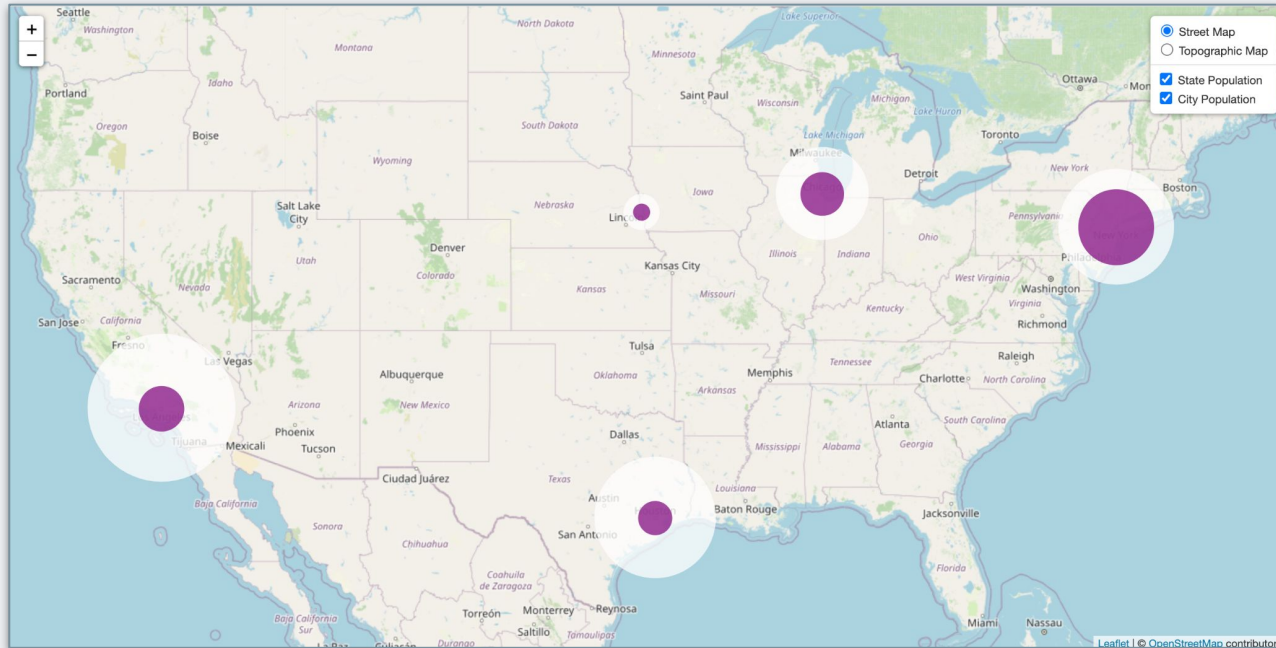

Time's Up! Let's Review.

# Activity: Perform a Layer

With this map, we can find out the portion of a state's population that lives in its largest city! Besides having the largest population, New York also has the largest percentage of its state's population.

## Fun Fact

Over 40% of New York State's population lives in New York City.

# Questions?

# GeoJSON

# GeoJSON

Most applications that we build will pull data from existing datasets. And, one of the easiest ways to deliver geographical data is by using the GeoJSON format.

```

# GeoJSON

---

GeoJSON is an open-standard format for representing simple geographical features along with their nonspatial attributes by using JavaScript Object Notation (JSON).

This GeoJSON document depicts all the earthquakes that have taken place across the globe within the past hour.

```
{ "type": "FeatureCollection", "metadata": { "generated": 1650905924000, "url": "https://earthquake.usgs.gov/earthquakes/feed/v1.0/summary/all_hour.geojson", "title": "USGS All Earthquakes, PastHour", "status": 200, "api": "1.10.3", "count": 9 }, "features": [ { "type": "Feature", "properties": { "mag": 2.27999997, "place": "24 km E of Honaunau-Napoopoo,
```

# GeoJSON

---

GeoJSON has the following characteristics:

It represents geographical features by coordinates and can attach other properties to these features.

The types of features are the following:

Point

LineString

Polygon

MultiPoint

MultiLineString

MultiPolygon

## Instructor Demonstration

---

# Geographical Coordinates and Properties

# Questions?

# Activity: GeoJSON

In this activity, you'll work with GeoJSON data from the [U.S. Geological Survey \(USGS\)](#) to make plot markers representing occurrences of earthquakes.

Suggested Time:

15 minutes

# Activity: GeoJSON

## Instructions

Use the starter files `index.html`, `logic.js`, and `style.css` provided in the [Unsolved](#) folder.

- Open the [logic.js](#) file.
- Note that your starter code places an API call to the USGS Earthquake Hazards Program API. Take a moment to study the `features` array that we extract from the response.
- Add logic to create a GeoJSON layer that contains all the features retrieved from the API call, and add the layer directly to the map. You can reference today's previous activities and the [Leaflet Using GeoJSON with Leaflet](#) tutorial.
- Create an `overlayMaps` object by using the newly created earthquake GeoJSON layer. Pass `overlayMaps` to the layer control.

## Bonus

Create a separate overlay for the GeoJSON and a base layer by using the `street` tile layer and the `topo` tile layer. Add these to a layer control. If you get stuck, refer to the previous activity.

Add a popup to each marker to display the time and location of the earthquake at that location.

## Hint

Refer to the following Leaflet documentation:

- [GeoJSON](#)
- [Using GeoJSON with Leaflet tutorial](#)

If you want to reformat the time from the GeoJSON data for the bonus, you may wish to use the JavaScript method [Date\(\)](#)

Time's Up! Let's Review.

**How do we create a GeoJSON layer?**

# Create a GeoJSON layer

---

We pass all the earthquake feature data to the `L.GeoJSON` method.

We save its return value (which is the new Leaflet GeoJSON layer) in the `earthquakes` variable.

What's happening with the `onEachFeature` function that we defined?

# onEachFeature Function

---

During layer creation, Leaflet supplies a built-in hook named `onEachFeature`.

We can define a function that performs custom functionality with the addition of each feature object to the GeoJSON layer.

In this case, we give each layer a tooltip with the time and location of the earthquake.

**What are `baseMaps` and `overlayMaps` for?  
Why not just add the layers directly to the map?**

**If we add the GeoJSON layers  
directly to the map, we can't use  
a layer control with them.**

# baseMaps and overlayMaps

---

After creating our GeoJSON layer, we create a `baseMaps` layer and an `overlayMaps` layer.

This matches what we did in the previous activity, except here we use `earthquakes` instead of `cities` for our overlay.

# Questions?
